Grower's Secret Phosphorus Fertilizer is a mined fertilizer used for the correction of phosphorus deficiencies in organic and conventional food production. It can be applied to prevent or correct phosphorus deficiencies which can negatively affect root development, fruit and flower production, plant growth and yields. For best results apply Grower's Secret Phosphorus Fertilizer according to recommendations based on plant tissue or soil analysis for a given crop.

MIXING INSTRUCTIONS: Mix in the desired amount of water for application. Continual agitation is needed.

DIRECTIONS FOR USE: Can be applied as a spray or through irrigation to the soil or as a foliar application. Avoid foliar applications when plants are under heat or drought stress. Constant tank agitation is needed during application or injection if applied as a liquid. Finish application at least 1/2 hour before the end of the irrigation cycle.

Application as a dry product is also possible. Check your equipment operating instructions for settings if in question. Applications rates should be based on soil and foliar analysis of a given crop.

Always perform a phytotoxicity test on a small part of the field before large-scale application. If applying with acidifiers or other products, always conduct a small jar compatibility test with representative quantities of mix products and water. To lower the risk of phytotoxicity, make applications early mornings or late evenings.
